

Instructions

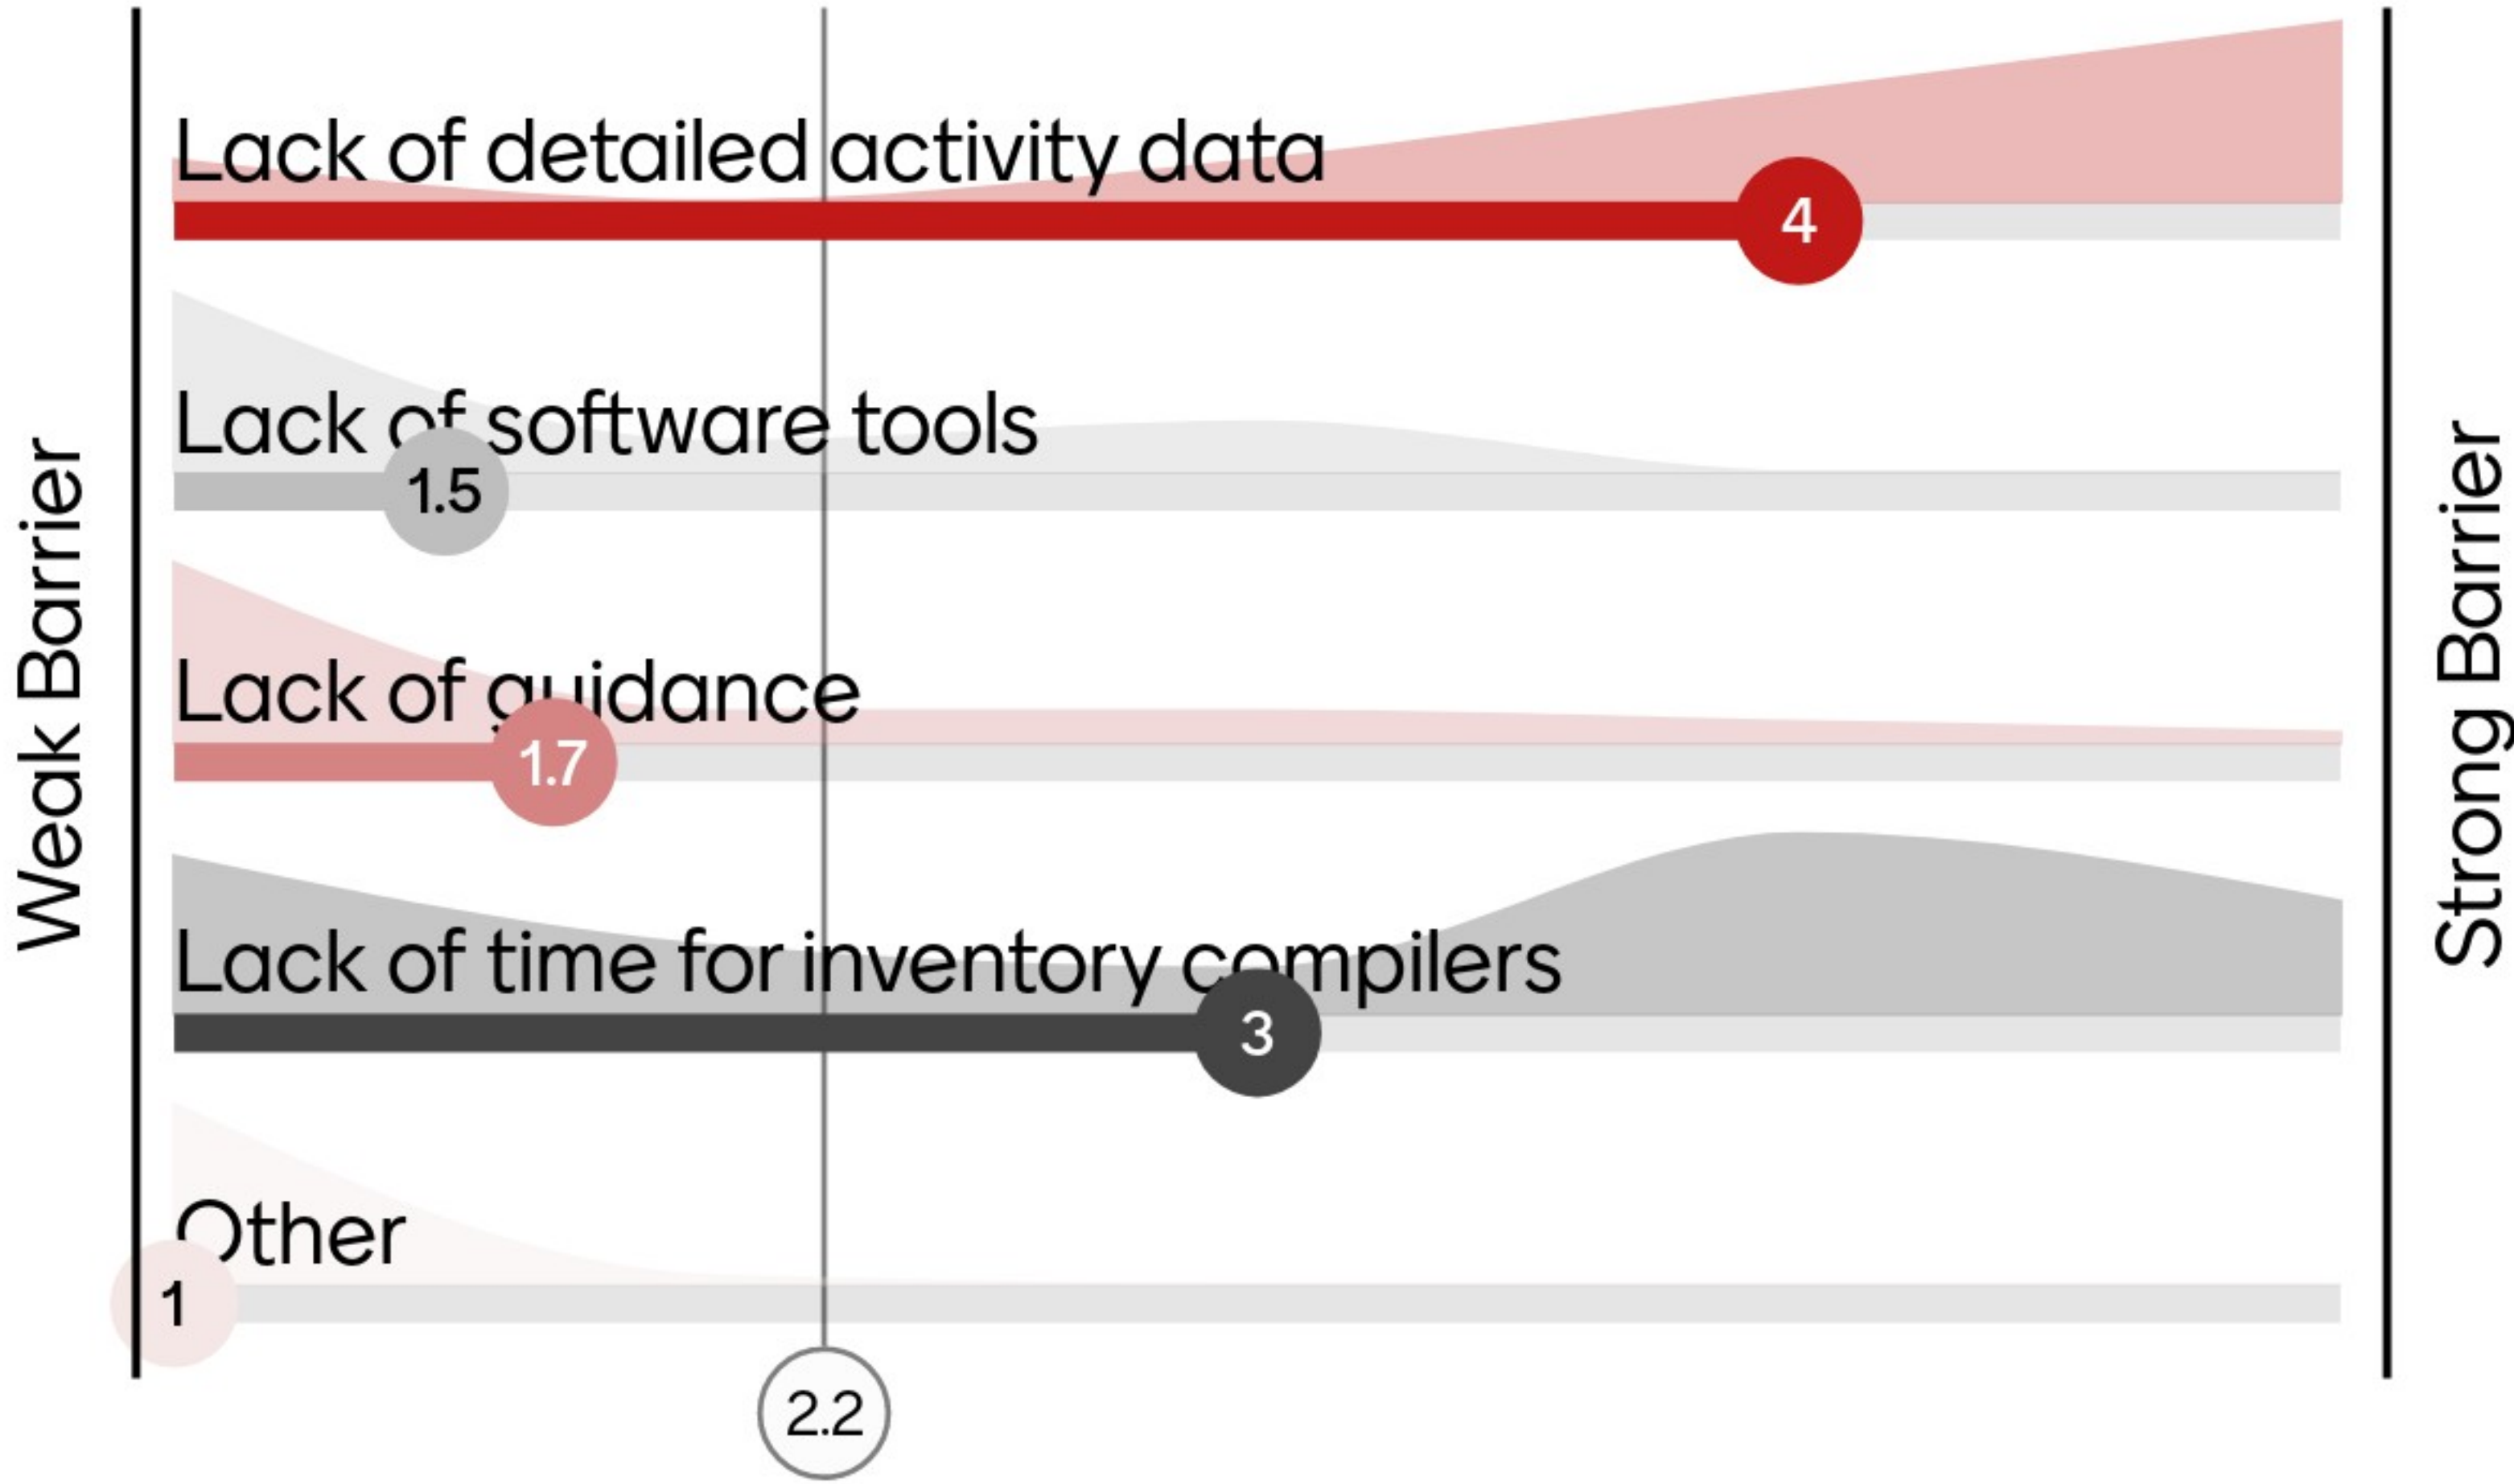

What method do you use to calculate ammonia emissions from manure management?

Use of the Excel N flow tool

Rank the barriers to moving to a higher Tier (only those currently using Tier 1 or 2)

Any other thoughts?

AgreeTool & Nflow tools are complementary

both software tools are helpful and should be developed

Is it considered as a Tier2 approach if you just put in national number of animal and use default for all other variables?

Added NMVOC and PM calculations. CS Nex data and housing period and other. Modified EF according abatement measures. Working with Excel is comfortable. Easy to add additional estimates.

Could we share best practices on how to modify the n-flow tool?

the latest changes have made in the AgreeTool you lose the results after EPEM methodology, have you? Online Tool went to IPPC methodology.
