

PM emissions from field burning of agricultural wastes (3F)

- Edit Paráda from UBA noticed a discrepancy in an emission factor for $PM_{2.5}$ for maize
 - Value was very low, compared to waste from other crops
- Values in all Guidebook versions from 2013 are taken from the same scientific paper
 - Value was correct in 2009, 2013 and 2016 but incorrect in 2019 and 2023
 - Correct value is 0.006 kg kg^{-1} dry matter
- If you think you have found an error then ask (and thanks to Edit)
